

Invitation Card Editor — UI/UX Design Spec

Target user: 50+, low technical confidence
Feel: Premium, luxurious, modern, Canva/Adobe Express-simple
Platform: Offline Android, Flutter

1. Visual Design System

Color Theme — "Warm Ivory & Gold"

A theme that reads as premium stationery, not a tech app.

Role	Color	Hex
Background	Warm ivory/cream	#FBF7F0
Primary accent	Deep champagne gold	#C6A15B
Secondary accent	Soft charcoal	#2E2A26

Role	Color	Hex
Text (primary)	Near-black warm gray	#3A3532
Text (secondary/hints)	Muted taupe	#8C8275
Success/confirm	Muted sage green	#7A9471
Danger/delete	Soft terracotta red	#B5654F
Card surfaces	Pure white	#FFFFFF

No pure black, no neon colors — everything slightly warmed, like fine paper and foil.

Typography

- **Headings/branding:** An elegant serif (e.g., Playfair Display) — signals "invitation," not "app."
- **UI labels/buttons:** A clean, highly legible sans-serif (e.g., Inter or Nunito Sans) at a **minimum 16sp**, scalable to 20sp — this is non-negotiable for the 50+ audience.
- Generous line spacing and letter spacing throughout; nothing condensed.

Iconography

- Line icons (not filled), 2px stroke, rounded caps — soft and elegant rather than sharp/technical.
- **Every icon is paired with a text label.** No icon-only buttons anywhere in the app. This is the single most important accessibility decision for this audience.

Buttons

- Large touch targets: minimum 56dp height.
- Primary buttons: solid gold fill, charcoal text, subtle rounded corners (12dp radius), soft drop shadow to feel "pressable."
- Secondary buttons: outlined, gold border, transparent fill.
- Destructive actions (delete): terracotta outline, always require confirmation dialog.

Animation Philosophy

- Subtle and slow (250–350ms), never flashy or bouncy — this should feel calm, not gamified.
- Screen transitions: gentle horizontal slide or soft cross-fade.
- Button press: slight scale-down (0.97x) + shadow lift, like pressing a real card.

- Success actions (save, export): a soft gold checkmark animation with a gentle "settle" motion, plus a brief haptic tap.
 - No spinning loaders where avoidable — use a calm pulsing gold dot instead.
-

2. Screen-by-Screen Design

Screen 1 — Home / My Invitations (Library)

The app opens directly here. This is "home base."

- **Top bar:** App name in serif logo-type, centered. Small settings gear icon (top-right, labeled "Settings" beneath it).
- **Body:** A grid of card thumbnails — each past invitation the user has created or imported, shown as a real preview thumbnail with a soft shadow (like photos on a table).
 - Each thumbnail has: title text below it (editable), last-edited date in small muted text.
 - Tap thumbnail → opens Editor with that invitation.
 - Long-press or a small "⋮" labeled "Options" → menu: Rename, Duplicate, Delete, Export, Print.

- **Empty state** (first launch): centered illustration of an elegant blank card, with text "Create your first invitation" and one large gold button.
- **Bottom area:** One large, unmissable primary button, pinned: **" + New Invitation"** (gold, full-width, 56dp tall).

Screen 2 — New Invitation (Source Selection)

Opens as a bottom sheet or full screen when "+ New Invitation" is tapped.

Three large, clearly labeled option cards (not small icons):

1. **"Upload a File"** — upload icon + text — accepts PDF, JPG, PNG.
2. **"Start from a Template"** — template icon + text — opens Template Library (Screen 3).
3. **"Blank Card"** — blank page icon + text — opens Editor with an empty canvas.

Each option card is large (full-width, ~100dp tall), tappable anywhere on the card, with a one-line description underneath (e.g., "Choose a PDF or photo of your invitation").

Screen 3 — Template Library

- Grid of pre-designed invitation templates (birthday, wedding, anniversary, baby shower, holiday, blank).
- Category filter as large horizontal pill tabs at top (labeled, not icon-only): "All," "Wedding," "Birthday," "Holiday," "My Saved Templates."
- Tapping a template → opens directly in Editor, pre-loaded.
- "My Saved Templates" tab shows templates the user has saved from their own past designs.

Screen 4 — The Editor (core screen)

This is the most important screen and needs the most restraint.

Layout:

- **Top bar:** Back arrow (labeled "Back"), invitation title (tap to rename), and a single labeled **"Save"** button (top-right, always visible).
- **Canvas (center, most of screen):** The invitation image/PDF page shown at a comfortable zoom, with pinch-to-zoom and drag-to-pan enabled.
- **Bottom toolbar:** A single row of large, labeled icons — no more than 4-5 at once, to avoid overwhelm:
 - **"Add Text"**
 - **"Voice Type"** (microphone icon)

- **"Templates"** (jump to template library)
- **"Print / Export"**
- **"Menu"** (overflow: undo/redo, page settings, help)

Adding text (tap "Add Text" or tap empty canvas area):

- A text box appears on the canvas with a soft gold outline and 4 corner handles (drag to resize) plus a rotate handle.
- Tapping into the text box opens a **floating formatting panel** that slides up from the bottom (not a cramped toolbar):
 - **Font** — large scrollable list of font names, each rendered in its own actual font so the user can see, not guess.
 - **Size** — a simple large +/- stepper with a live preview, not a tiny slider.
 - **Color** — a row of large circular color swatches (curated palette, ~12 elegant colors) plus one "More Colors" option.
 - **Alignment** — left/center/right, shown as labeled buttons.
 - **Bold/Italic** — clearly labeled toggle buttons.
- A **microphone button sits directly inside the text box itself**, so voice typing is discoverable

exactly where text is created, not buried in a menu.

Voice typing flow:

- Tap the mic icon → it turns solid gold and gently pulses while listening.
- A caption strip appears above the keyboard area showing live transcribed text.
- Tap mic again (or a labeled "Done" button) to stop — text is inserted into the box.
- If no speech is detected, a warm, non-technical message: "I didn't catch that — try again?" with a retry button.

Moving/deleting elements:

- Tap any text box once to select it (gold outline + handles appear).
- A small labeled toolbar appears just above the selected box: **"Delete," "Duplicate," "Bring to Front."**
- Delete always shows a one-tap-undo snackbar at the bottom ("Text deleted. Undo") rather than a scary confirmation dialog — safer for accidental taps, less scary for cautious users.

Screen 5 — Save as Template Dialog

Triggered from the editor's overflow menu ("Save as Template").

- Simple centered dialog: "Name this template," one text field, "Save" and "Cancel" buttons.
- Confirmation: brief gold checkmark animation, dialog closes.

Screen 6 — Export / Print

Opens as a bottom sheet from the "Print / Export" button.

- **"Save as PDF"** — large labeled button with a document icon. Tapping shows a brief progress state, then a success screen: "Saved!" with the file name and two follow-up buttons — **"Open"** and **"Share."**
- **"Print"** — large labeled button with a printer icon. Opens Android's native print dialog directly (no custom print UI needed — Android handles printer selection).
- Both options shown together as two large stacked cards rather than tiny buttons, so the choice is unmistakable.

Screen 7 — Settings

Simple list, generously spaced, each row with an icon + label + short description:

- **Text Size** — app-wide UI text scaling (Small / Medium / Large) — important for this audience.
 - **Default Export Location**
 - **App Theme** — Light (default) / Warm Dark, in case of preference.
 - **Help & Tutorial** — replays a short onboarding walkthrough.
 - **About** — version, credits.
-

3. Onboarding (first launch only)

3 short slides, skippable, each with one illustration, one sentence, and a "Next" button (final slide says "Get Started"):

1. "Turn any invitation into your own design."
 2. "Tap anywhere to add text — even use your voice."
 3. "Save, print, or share when you're ready."
-

4. Complete User Flow (happy path)

Launch App
→ Home (Library)

- Tap "+ New Invitation"
- Choose: Upload File / Template / Blank
 - [Upload] Pick PDF/JPG/PNG from device → Editor opens with file loaded
 - [Template] Browse Template Library → tap one → Editor opens pre-filled
 - [Blank] Editor opens with empty canvas
- Editor
 - Tap canvas or "Add Text" → text box appears
 - Tap text box → formatting panel slides up (font/size/color/align)
 - Optionally tap mic → speak → text inserted
 - Drag/resize/rotate text box as needed
 - Tap "Save" (top bar) → returns to Home, thumbnail updated
 - OR tap "Print/Export" → choose Save as PDF or Print → done
 - OR open menu → "Save as Template" → name it → saved to Template Library
 - Home
 - Tap any past invitation → reopens in Editor
 - "...•••" on a thumbnail → Rename / Duplicate / Delete / Export / Print

6. Premium Smart Features

6.1 Smart Template Mode

Goal: once a user has positioned and formatted the recipient-name text on a template, reusing that template for a new guest should require **zero repositioning or reformatting** — just a new name.

How it fits the existing flow:

- In the Editor, the user places a text box, types or speaks the recipient's name, and formats it (font, size, color, alignment, rotation) exactly as already described in Screen 4.
- When the user saves this as a template (Screen 5, "Save as Template"), the app silently stores the exact position (x/y coordinates), size, rotation, font, color, and alignment of that text box alongside the design — no extra step or dialog needed from the user.
- **This text box is now marked internally as the "Name Field"** for that template. It's the one field the app treats as "the thing that changes each time."

Reusing the template — new screen behavior:

- When the user opens a saved template (from Home or the Template Library) that has a stored

Name Field, the Editor opens with a **gently highlighted text box** (soft gold pulse, one time only) sitting exactly where the name goes, showing placeholder text: *"Tap or use voice to enter name."*

- The user simply taps it and types, or taps the mic and speaks — the new name appears **already in the correct position, font, size, color, and rotation**. No formatting panel needs to open at all unless the user chooses to adjust it.
- A small labeled pill near the field reads **"Smart Field"** so the user understands why it behaved differently (transparency, not magic) — tappable for a one-line tooltip: "This spot remembers its formatting from your saved template."
- If the user drags or reformats this field on a specific invitation, that change applies only to *that* invitation, not the saved template — a small **"Update Template?"** prompt offers to save the new formatting back if the user wants that to be the new default.

6.2 Smart Font Matching

Goal: when text is added to an uploaded invitation, it should visually blend in with the invitation's existing printed text, rather than needing the user to guess or match manually.

How it fits the existing flow:

- Immediately after a user uploads a PDF/JPG/PNG (Screen 2 → Editor), the app briefly analyzes the image/text in the background. A calm pulsing gold dot with the label **"Reading your invitation..."** shows for a moment (typically under a couple of seconds).
- Once analysis completes, nothing disruptive happens — no popup, no interruption. Instead, the **formatting panel's defaults are simply pre-set** to the app's best-guess match (closest font style, size, and color) whenever the user adds a *new* text box on that invitation.
- A small labeled tag appears the first time inside the formatting panel: **"Suggested to match your invitation"** next to the font/size/color selectors, so the user understands why those particular defaults were chosen — and can still change any of them freely using the same controls from Screen 4.
- If the app can't confidently detect a nearby style (e.g., blank canvas, no text nearby), it simply falls back to the app's normal elegant default (serif, medium size, charcoal) with no error or interruption — this should never feel like a failure state to the user.

Design principle for both features: the "smart" behavior should always be visible and reversible through the same simple controls already established (tap, formatting panel, drag) — never a hidden automation the user can't see or override.

7. Accessibility & Usability Notes for 50+ Users

- Minimum text size 16sp everywhere; user-adjustable up to 20sp+ in Settings.
- Every icon labeled with text — never rely on icon meaning alone.
- Touch targets ≥ 48 dp, ideally 56dp for primary actions.
- Destructive actions use undo-snackbars over scary confirmation dialogs where safe to do so (delete text); irreversible actions (delete whole invitation) still get a confirmation dialog.
- High color contrast between text and background (WCAG AA minimum).
- No gestures required beyond tap, drag, and pinch-zoom — no swipe-menus or hidden gestures.
- Calm, slow animations — nothing that feels rushed or game-like.

- Consistent button placement across screens (primary action always bottom or top-right) so muscle memory builds quickly.

This is the full design. Nothing here is code — it's the blueprint we'll build screen-by-screen once you confirm.
